FOREWORD

CONTINUING EMPHASIS on coordinated planning for the organization and delivery of medical care services at the State and local level has generated many requests for State health expenditures. Congressmen, State government officials, State and local planning agencies, and health researchers have expressed their need for such data. In response to this need, the Social Security Administration has undertaken a two-stage research project to distribute the national health expenditures by State.

This report is the second half of a study of personal health care spending in each State for fiscal years 1966 and 1969. Volume I presented State estimates of health expenditures under each public program by source of funds (Federal and State and local) and type of expenditure. Volume II presents State estimates of total spending by source of funds and type of expenditure.

Analysis of total expenditures in 1969 is presented in terms of the types of services purchased, the source of financing, and demographic State variables. Spending in 1969 is compared with that of 1966—the year before Medicare and Medicaid began operations—in order to explore the impact of these programs on the financing of health and the variation of this impact by State.

The General Tables were produced by the “System for Automated Tabular Composition,” a computer system in Baltimore, Maryland. They were set on Linotron equipment at the Government Printing Office in Washington, D.C.

JOHN J. CARROLL,

Assistant Commissioner for Research and Statistics.

OCTOBER 1974.

EXPENDITURES IN 1969

In 1969, persons in the United States spent \$51.9 billion for personal health care.¹ The average for the Nation amounted to \$257 per person, but it ranged widely throughout the country.² A variety of economic, demographic, and social factors determine health care spending in a State. The relative prices of care, level of income, amount of insurance, supply of facilities and personnel, and availability of public funds all affect the level of spending. The size of a State's population, as well as its age and income composition, also has an impact on the amount being spent: Older people incur larger health bills; high-income residents can afford to spend more than those with low incomes.

The aggregate amount of money spent for health care in each State is not determined by the usual laws of supply and demand that affect other industries, but instead by a confluence of both supply and demand factors. For example, additional demand for medical services does not always create additional supply. However, abundant supply may create additional demand, particularly for elective procedures. Another unique feature of the medical care market is that excess supply will not result in lower prices. Due to the large proportion of hospital costs that are fixed, unfilled hospital beds mean higher costs per patient day. In addition, unlike their selection of other goods or services, consumers of health care do not always choose what they will purchase and do not "shop around" for a bargain price. Much of the health care consumers receive is determined by the physician or by what is available.

One of the most significant factors in explaining State variation in health care expenditures is per capita personal income.

Personal income is interrelated with many of the other factors determining health care spending. Health personnel often choose to practice in high-income areas and their fees reflect the ability of residents to pay. Private health insurance coverage is also influenced by income levels. As a result, income and health spending have a simple correlation coefficient of 0.9, statistically different from zero at the 0.01 level. The relationship between these two variables is further demonstrated in table A, showing the ranks of the two variables.

The most meaningful comparison of health care expenditures among the States is in terms of per capita amounts, which varied significantly throughout the Nation. In the East South Central region, per capita spending averaged only \$184 while in the Pacific region, residents incurred bills averaging \$309, as shown below:

Region and division	Per capita amounts	Ratio to U.S. average
United States	\$256.89	---
Northeast	295.46	1.15
New England	307.18	1.20
Middle Atlantic	291.84	1.14
North Central	251.58	.98
East North Central	254.66	.99
West North Central	243.98	.95
South	211.49	.82
South Atlantic	223.24	.87
East South Central	184.17	.72
West South Central	211.50	.82
West	294.58	1.15
Mountain	247.63	.96
Pacific	309.09	1.20

A much wider range in average health care spending is exhibited among the States.³ Residents in Massachusetts had by far the highest medical expenditures, averaging \$346 per person—\$90 more than the national average. This high per capita amount is not surprising since average costs for hospital care—the largest expenditure item—are highest in Massachusetts; this State ranks 8th in terms of per capita personal income; it ranks among the top States in terms of facilities and personnel; and it has a relatively high aged population (tables A-F).

New York and California follow with high per capita medical expenditures of \$338 and \$326, respectively. In these States, too, the high outlays reflect demographic conditions and the availability of health resources. The lowest per capita health outlays were in the two poorest States—Mississippi and Arkansas. Average spending per resident in these States was \$138 and \$166, respectively. Both of these States are among those with the lowest physician-population ratios and expense per patient day in community hospitals.

Per capita personal health care spending is below the national average (\$257) in more than half of the

¹Personal health care expenditures represent all outlays for health services and supplies, except expenses for prepayment and administration, government public health activities, and amounts spent by private voluntary agencies for fund-raising and administrative activities.

²For detailed data on national health spending in 1969, see Dorothy P. Rice and Barbara S. Cooper, "National Health Expenditures, 1929-71," *Social Security Bulletin*, January 1972.

³The District of Columbia will be omitted from the discussion, since a large proportion of persons who live in Virginia or Maryland receive medical care in D.C.

SOURCE: Personal income based on data from *Survey of Current Business*, August 1971, U.S. Department of Commerce.

States, but this relationship also holds for per capita personal income (chart 1). The following tabulation shows that while nearly a fourth (24 percent) of all States spent under \$200 per person for health care, less than a third (32 percent) of the States with more than two-fifths of the population spent more than the average:

Total per capita expenditures, FY 1969*	Number of States	Percentage distribution	Percent of U.S. population represented by States
Total	50	100.0	100.0
Less than \$200	12	24.0	17.7
\$200-\$257	22	44.0	38.9
\$258 or more	16	32.0	43.4

*National average is \$257.

RELATIONSHIP TO PERSONAL INCOME

Health spending as a proportion of personal income is an indicator of the relative amount of resources in each State allocated to health and medical care. For the Nation as a whole in fiscal 1966, total personal health care spending represented 6.4 percent of personal income with private and public spending representing 5.1 percent and 1.4 percent, respectively. By 1969, the total and public proportions had increased considerably (to 7.2 and 2.6 percent, respectively) while the private proportion dropped slightly to 4.7 percent (table 36).

The overall increase in the relative proportion of personal income devoted to health care spending is mainly the result of the rapid rise in medical care prices which increased at a faster rate than prices in general. In addition, increased coverage under government insurance programs enabled many persons previously unable to afford medical care to receive services and, as a result of this additional effort, per capita health care spending grew faster than per capita personal income during the 3-year period.

The growth in the public proportion results from two sources: (1) the transfer to the public sector of some expenditures previously made privately, and (2) additional spending for persons who did not receive services prior to Medicare and Medicaid.

All States experienced a rise in total and public health care spending relative to personal income during 1966-69. Not all States, however, experienced a decline in the private share; in 12 States, private spending increased as a percentage of personal income.

Because total health care spending and per capita income are so highly correlated, one would expect little variation in the proportion of personal income in a State devoted to medical care. In 1969, the U.S. proportion was 7.2 percent, and the variance over States was only 1.8 percentage points. By source of funds, the range in the private proportion was wider, with Alaska the lowest (2.6 percent) and Utah the highest (5.7

The explanation for high or low proportions in each State is similar to that for the relative level of total health outlays. However, differing price levels among the States do not help explain the differences in spending as a percentage of income, since within States income and price levels are highly correlated. The differences chiefly stem from variations in the availability of services within each State, patterns of medical practice, extent of third-party coverage, relative priority assigned to medical care by State residents, and from other demographic factors.

Health care outlays in a State for a particular type of service or supply depend on several factors. First, the availability of facilities and of health professionals has a significant impact not only on the amount being spent in a State, but also on the type of service being purchased. In general, access to physicians is a decisive factor in spending for the three largest expense categories. With few exceptions, hospital admissions are authorized by physicians who also determine what course of treatment is provided. Similarly, drug prescriptions must originate with the physician.

Nearly two-thirds of all health outlays are spent on two primary care items. Hospital care, by far the largest single item of expenditure, represents over two-fifths of the average personal health care bill. In 1969, Americans spent \$22.4 billion or an average of \$111 per person for hospital care. For physicians' services, the second largest expense category, the average expenditure was \$59 per person, or more than a fifth of the total bill. The third largest item of expenditure in 1969 was drugs and drug sundries (\$32 per person), followed by spending for dentists' services (\$19 per person) and nursing-home care (\$12 per person). The remaining outlays comprise less than a tenth of the total personal health care bill and represent expenditures for other professional services, eyeglasses and appliances, and other health services which could not be classified elsewhere (tables 17, 20, and 23).

The following tabulation shows the distribution of 1969 personal health care services by type of expenditure:

Type of expenditure	Amount (in billions)	Percentage distribution
Total	\$51.9	100.0
Hospital care	22.4	43.1
Physicians' services	11.8	22.8
Dentists' services	3.8	7.4
Other professional services	1.3	2.5
Drugs and drug sundries	6.5	12.5
Eyeglasses and appliances	1.8	3.4
Nursing-home care	2.5	4.8
Other health services	1.8	3.6

Hospital care.—The \$111 average hospital expenditure is not only the largest item on the Nation's medical bill, it also represents the largest amount of government funding. About \$11.6 billion (52 percent) came from public sources and the remaining \$10.8 billion from private funds. Both the amounts and the public share, however, vary significantly by State.

The amount of hospital care spending in a State is strongly related to hospital care prices and hospital bed supply. The correlation between per capita hospital expenditure and average cost (measured by expense per patient day in community hospitals) is 0.7. Variation in average cost by State is the result of differing wage levels, equipment and procedures employed, occupancy rates, and so forth. The correlation between expenditures and bed supply is not as high, but still significant—0.6.⁴

In 1969, the largest per capita outlay for hospital care (\$172, more than 50 percent greater than the national average) was in Massachusetts. As noted earlier, Massachusetts had the highest hospital expense per patient day—\$94 compared with \$70 nationally—and a greater than average rate of community hospital beds per 1,000 residents—4.71 beds compared with 4.14 beds nationally (table B). More than half of the expenditures for hospital care in Massachusetts were financed from private funds (\$91, the highest consumer payment in the Nation).

In New York, the State with the second largest hospital bill per resident (\$158), hospital care is financed primarily from public funds (65 percent). Of the \$103 public contribution, more than 52 percent came from State and local sources. Even greater public financing of hospital care occurs in Alaska, the State with the highest per capita public hospital care outlay in the 50 States—double the national average. Just \$2 of the \$143 per capita hospital outlay in Alaska was paid privately. The availability of Public Health Service hospitals for more than 50,000 Indian and native Alaskan residents and the shortage of non-Federal facilities and manpower account for this large public effort (table C).

The lowest average hospital care outlays were in Mississippi (\$64) and Arkansas (\$68). These States ranked 47th and 48th, respectively, in per diem hospital

TABLE B.—Community hospitals: Number of beds and rate per 1,000 residents, expense per patient day, and rank, by State, 1969

¹Includes MD's and DO's. Data for DO's are for 1967.

SOURCE: MD's—*Distribution of Physicians, Hospitals, and Hospital Beds in the U.S., 1968*, American Medical Association. DO's—*Health Resources Statistics, 1971*, National Center for Health Statistics, Department of Health, Education, and Welfare.

expenses, and 43th and 28th, respectively, in hospital beds per 1,000 residents. They were among the five States with the lowest ratio of non-Federal physicians per 100,000 residents. Public funds finance about 64 percent of the average hospital bill in Arkansas. More than a third of these outlays are made through State and local programs for general hospital and medical care. Medicaid outlays in both Arkansas and Mississippi are low.

Although the range in per capita hospital care outlays among the States is wide, two-thirds fall in the \$80 to \$120 category shown as follows:

Total per capita hospital care outlays, FY 1969*	Number of States	Percentage distribution	Percent of U.S. population represented by States
Total	50	100.0	100.0
Less than \$80	7	14.0	9.3
\$80-\$99	18	36.0	34.3
\$100-\$119	16	32.0	26.0
\$120 or more	9	18.0	30.4

*National average is \$111.

While public financing of hospital care ranged from 42 to 85 percent, the public share was more than 50 percent in 32 States, as shown in the following tabulation:

Public share of hospital expenditures, FY 1969*	Number of States	Percentage distribution	Percent of U.S. population represented by States
Total	50	100.0	100.0
Less than 45 percent	7	14.0	15.2
45-49 percent	11	22.0	22.6
50-54 percent	19	38.0	39.9
55 percent or more	13	26.0	22.3

*National average is 52 percent.

Physicians' services.—Over a fifth of all personal health care outlays were spent for physicians' services—an average of \$59 per person. The amount spent, however, was as high as \$84 in California and \$74 in Washington and as low as \$29 in Mississippi and \$30 in South Carolina.

In general, the amount spent for physicians' services in a State depends on the availability of these personnel and the price of their services. Using hospital expense per patient day as a price surrogate, the two States with the highest per capita physician expenditures ranked among the seven States with the highest prices (table B) and among the top 14 States in terms of physician/population ratio (table C). Similarly, in the States with the lowest per capita expenditures, both the supply of physicians and prices were low.⁵

⁵The simple correlation between the supply of physicians per capita and per capita expenditures for physicians' services is 0.8, statistically different from zero at the 0.01 level.

As with spending for hospital care, the range in per capita spending for physicians' services was wide, but 31 States had total per capita outlays between \$40 and \$60, as shown below:

Per capita outlays for physicians' services, FY 1969*	Number of States	Percentage distribution	Percent of U.S. population represented by States
Total	50	100.0	100.0
Less than \$40	5	10.0	4.3
\$40-\$49	14	28.0	16.9
\$50-\$59	17	34.0	37.4
\$60-\$69	9	18.0	19.2
\$70 or more	5	10.0	22.2

*National average is \$59.

On the average, the government contributed 23 cents out of every \$1 spent for physicians' services. The extent of public support in a State depended largely on the relative size of its Medicare and Medicaid populations. The public share was highest (32 percent) in Oklahoma, Florida, and Arkansas—States with large welfare and/or aged populations. The public share was lowest (13-15 percent) in Maryland, Indiana, and Hawaii—States with lower than average welfare and aged populations. The following tabulation groups the States according to the size of the public share:

Public share of physicians' expenditures FY 1969*	Number of States	Percentage distribution	Percent of U.S. population represented by States
Total	50	100.0	100.0
Less than 20 percent ..	16	32.0	30.6
20-24 percent	13	26.0	31.3
25 percent or more ...	21	42.0	38.1

*National average is 23 percent.

Drugs and drug sundries.—Drugs and drug sundries represent the third largest item of expenditure, averaging \$32 per person. Most of this outlay (\$30) is privately funded with little private health insurance to reduce direct consumer payments.

The far northeastern States (Maine, New Hampshire, and Vermont) and some southeastern States (West Virginia, the Carolinas, Alabama, and Mississippi) have the lowest per capita expenditures for drugs—about \$10 below the national average. Per capita outlays for drugs and drug sundries are highest in the Mountain States, particularly Nevada (\$53) and Utah (\$48). Private per capita outlays for drugs and drug sundries in Utah even exceed private payments for hospital care in that State (table 21).

Florida is another State with relatively high outlays for drugs (\$41 per capita). Its large aged population—over 13 percent of the total—accounts for this since the aged are more likely to have illnesses which require the use of maintenance drugs (table D).

TABLE D.—Number and percent of persons aged 65 and over and persons receiving welfare, by State, 1969

¹Population as of July 1.

²Represents number receiving money payment as of January 1.

SOURCE: Population—Bureau of the Census *Current Population Reports*, Series P-25, No. 437. Public assistance beneficiaries—*Social Security Bulletin*, June 1969, table M-2.

Dentists' services.—Nearly \$19 per person was spent on dental care in 1969. Private payments alone averaged \$18. Here, too, demographic factors and availability of dentists determined relative spending. Per capita amounts were highest in California (\$29) and New York (\$28). The 10 States with the highest per capita expenditure for dental care ranked among the 10 States with the largest dentist-population ratio (table E). Mississippi and South Carolina had both the lowest per capita amounts, \$8 and \$10 respectively, and the fewest dentists per resident.

The extensive Medicaid programs in New York also contributed to the high dental care outlays there. Overall, the public share of dental care outlays represented only 6 percent of the total. In New York, however, the public share was 23 percent.

Nursing-home care.—Expenditures for this category represent only those made for skilled nursing-home care and exclude outlays for intermediate and personal care homes. The average per capita expenditure for this type of service was \$12 or about 5 percent of the average total bill. The amount spent in each State for nursing-home care is largely a function of government spending for such care, the availability of nursing-home beds, and the charges for such services.

Seven-tenths of all expenditures for nursing-home care were financed by three public programs—Medicare, Medicaid, and the Veterans Administration. The Veterans Administration (VA) provides care in its own facilities and pays for care on a contract basis in areas where there are no VA facilities; Medicare helps finance post-hospital care in approved extended-care facilities (ECF); and Medicaid helps finance care in approved skilled nursing homes. Medicaid alone paid for over half the total outlays for such care. For Medicare, Medicaid, and the contract portion of VA, the amount of nursing-home outlays in a State depends on the number of eligible persons requiring nursing-home services in that State, the availability of nursing-home beds, the charges for such services, and, for Medicaid, the scope of nursing-home benefits and level of payment for such care.

The highest per capita outlays for nursing-home care were in Wisconsin (\$27), Massachusetts (\$24), and Oklahoma (\$24). In these States, the number of available nursing-home beds was 1-1/2 to 2 times the national average (table F). In Wisconsin and Massachusetts, the government share of outlays for nursing-home care was greater than average and, in both these States, only about \$6 per person came from private sources. These relatively large government outlays are due to extensive nursing-home coverage under Medicaid. Massachusetts covers skilled nursing-home services for persons of all ages, with no limitations or requirements for prior authorization.

In contrast, in West Virginia and North Carolina only \$2 per capita in public and private funds was spent for nursing-home care—the smallest amounts and one-sixth the national average. For these States, the supply of nursing-home beds was only one-third the national average. Although nearly 11 percent of the residents in West Virginia were aged 65 and over, there were less

SOURCE: *Health Resources Statistics, 1970*, National Center for Health Statistics, Department of Health, Education, and Welfare. Wayne Callahan and Jacquelyn Watts, *Health Insurance For the Aged: Participating Health Facilities, July 1969*, HI-18, May 5, 1970, Office of Research and Statistics, Social Security Administration.

than 7 approved ECF beds per 1,000 Medicare enrollees compared with the national average of 17 beds.

Other health services and supplies.—The remaining health care services and supplies represent 4 percent of all personal health care expenditures. The distribution among the States is dependent upon the previously discussed demographic and economic characteristics. The amounts spent for each of the remaining types of expenditure, however, are not large enough to have a significant impact on the overall distribution of health care spending.

SOURCE OF FUNDS

In recent years, the growth of third-party payments for medical care has been well documented for the country as a whole. In 1969, three-fifths of all U.S. health care spending was financed by the various third parties (including government, private health insurance, and philanthropy and industry). Patients financed the remaining two-fifths by direct out-of-pocket payments (table 34). In this classification, spending by individuals for private health insurance and Medicare premiums are considered to be expenditures by private health insurance and government, respectively.

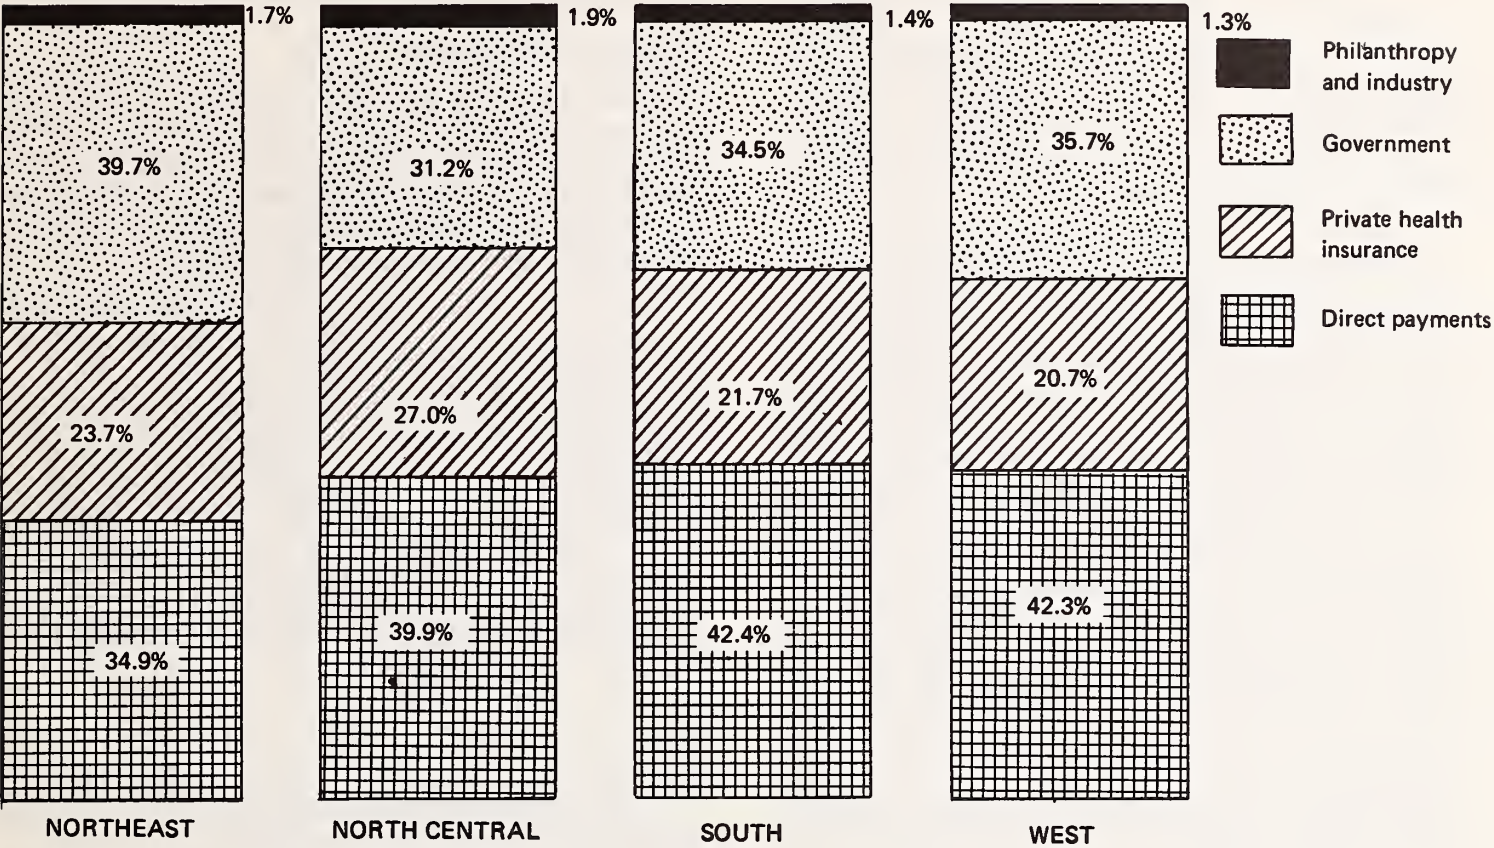

The distribution of expenditures by source of funds varies among the geographic regions. On a proportional basis, the highest third-party share (65 percent) and, as a consequence, the lowest share met directly was in the Northeast. Chart 2 shows that third parties financed the smallest proportion of outlays in the South and West (58 percent).

On a per capita basis, however, a somewhat different picture emerges. In the West and South, the share of the total met directly was almost identical. Per capita amounts, however, were quite different for the two regions. Per capita direct payments in the West (\$125) were highest among the four regions; those in the South (\$90) were the lowest (table 33).

Wider differences occur among the States in the distribution of the sources of funds, with the third-party share ranging from 52 percent in Idaho and Wyoming to 77 percent in Alaska. The most significant determinant of the total third-party share seemed to be the total government contribution. The share met by private health insurance also varied, but the range between the high and low extremes was narrower than that for the government. The remaining third-party share (from philanthropy and industry) represented only 1.6 percent overall and never reached a significant level in any one State.

Government programs represented the largest source of third-party payments in the Nation as a whole and in all but three States (Ohio, Indiana, and Michigan). Over a third of U.S. personal health care expenditures were financed by government programs. The largest of these programs—Medicare and Medicaid—as well as several smaller programs financed medical services obtained by eligible individuals in the private market. Other pro-

CHART 2. -- PERCENTAGE DISTRIBUTION OF PERSONAL HEALTH CARE EXPENDITURES, BY SOURCE OF FUNDS AND REGION, FISCAL 1969

grams, such as those administered by the Veterans Administration and the Defense Department (for military personnel), provided services directly through government-operated facilities. For the latter programs, spending varied considerably among the States since facilities are not evenly distributed.

Among the four regions, the Northeast had the highest share of government spending (40 percent) due mainly to the level of outlays under Medicaid. The lowest share (31 percent) was in the North Central States, and in the two remaining regions the government proportion was close to the national average.

The following tabulation shows the distribution of the individual States according to the proportion of total personal health care spending met by government funds:

Government funds as a percent of total expenditures, FY 1969*	Number of States	Percentage distribution	Percent of U.S. population represented by States
Less than 30.0 percent. .	7	14.0	17.1
30.0-35.3 percent	23	46.0	44.3
35.4-40.7 percent	15	30.0	26.8
40.8 percent or more . .	5	10.0	11.8

*National average is 35.3 percent.

In most of the States, the government share was fairly close to the national average. Among the States with a far higher proportion of government financing than the national average, the highest were Alaska (58.8 percent), New York (47.6 percent), and Arkansas (42.7 percent). Partly because of its large native Alaskan population, which is served by the Federal Public Health Service, and partly because of relatively large outlays by the military, public expenditures are disproportionately greater in Alaska when compared to private spending for medical care. In New York, large amounts spent under the State Medicaid program account for the larger-than-average government share. In Arkansas, per capita government expenditures are not exceptionally high, but there is relatively less private spending for health in Arkansas than in other States.

The States with the lowest government share included Utah (24.1 percent), Indiana (25.8 percent), and Ohio (26.6 percent) where per capita spending under government programs was well below the national average.

In the United States, private health insurance financed 23.5 percent of all personal health care spending. The following tabulation shows that the insurance portion in almost three-fourths of the States was within 3.5 percentage points of the national average:

IMPACT OF MEDICARE AND MEDICAID

The introduction of Medicare and Medicaid in fiscal 1967 significantly changed the financing of medical care in the United States. Government spending for health care jumped 139 percent from fiscal 1966 to fiscal 1969 and its share of the Nation's personal health care bill rose from 21 to 35 percent. This influx of government funds enabled many persons previously unable to afford health care to seek it and relieved many others of some of the burden of high medical bills. For several reasons, however, the impact of these programs varied considerably by State.

First, whether or not people took advantage of the services financed by these programs depended, in large part, on the availability of health facilities and supplies. As noted earlier, supply of care is not evenly distributed among the States. In addition, benefits offered under Medicaid differed widely from State to State, ranging from States with no program or a minimum benefit package for a limited population to States offering a broad range of benefits to large segments of the population. Medicare, too, affected States variously depending, in part, on the size of their aged population.

One measure of the impact of these two programs is the change in the distribution of the sources of funds for health care—the increase in the government's share and the decrease in the individual's direct share.

In fiscal 1966, over half of the spending for personal health care represented direct payments by consumers. By 1969, consumers were directly paying two-fifths. While per capita outlays rose about 40 percent in those 3 years, direct payments rose just 7 percent—only one-sixth the total increase. On the other hand, third-party spending per person grew 76 percent with government spending increasing 132 percent and private health insurance benefits rising 32 percent (table 35).

New York residents gained the most from Medicare and Medicaid. Although total per capita spending there rose 47 percent, direct out-of-pocket payments actually dropped 12 percent, from \$111 in 1966 to \$98 in 1969. Federal, State, and local governments, on the

other hand, together spent three times more per New York resident in 1969 than they had spent in 1966. This large increase in government funds was largely due to their liberal Medicaid program. Over \$1 billion in additional funds was spent by this program in New York in 1969, with two-fifths coming from the Federal Government. As a result, despite relatively high medical care prices in New York, average direct payments there were lower than those of the Nation as a whole.

Direct payments also decreased in six other States—Missouri, Delaware, Rhode Island, Michigan, Montana, and Wisconsin. In all these States, government spending rose substantially. In the case of Delaware, private health insurance also played a significant role in decreasing direct payments. Private health insurance payments in Delaware rose 58 percent in the 3-year period—nearly double the national increase (32 percent).

In Nevada and Wyoming the impact of Medicare and Medicaid was negligible. In both these States, government spending rose at only about a third the national rate. The very small welfare population and limited Medicaid programs in these States account for the relatively low rise in government spending. Total spending in Nevada, however, experienced a relatively rapid rise (53 percent). An influx of physicians and an unusually high rate of inflation led to this increase in expenditures.⁷ As a result, direct out-of-pocket payments in Nevada rose 61 percent and represented 55 percent of an average 1969 health care bill.

Government spending is not the only influence on changes in direct payments. Private health insurance payments also serve to lower out-of-pocket spending. Like government spending, increases in private health insurance benefit payments varied significantly from State to State. In the 3-year period, such outlays rose as little as 9 percent in Vermont, 15 percent in Wyoming, and 19 percent in West Virginia and New York. They rose as much as 88 percent in Alaska and 84 percent in Louisiana. Varying inflation rates and specific industry expansion of benefits help to explain this variation.

DEFINITIONS AND SOURCES OF DATA

Personal health care expenditures for the United States are reported annually by source of funds and type of expenditure as part of the article on national health expenditures in the *Social Security Bulletin*. The total national outlays that appear in this report are essentially the same as those used in the annual articles except that expenditures in territories and outlying areas or overseas are excluded. The differences between the U.S. total used in this report and the total personal health care outlays reported in the national health expenditure series (*Social Security Bulletin*, January

1972) were \$211 million in fiscal year 1966 and \$185 million in 1969.

Personal health care expenditures represent all expenditures for health services and supplies except government public health activities, medical research, and medical-facilities construction, and some expenses of philanthropic organizations (mainly for fund-raising

⁷From 1966 to 1969, the number of physicians in Nevada jumped 37 percent while expense per patient day in community hospitals rose at about the same rate.

activities). Also excluded from personal health care outlays, but included in national health expenditures, is the net cost of insurance—the difference between health insurance premiums and benefits paid—as well as the administrative cost of several government programs.

The total amount spent by each State for personal health care includes estimates of expenditures for all types of services and supplies. Total U.S. expenditures for each type of service or supply are distributed by State to obtain these estimates.⁸ Numerous allocation schemes were used based on health resources, supplies, unit costs, and other relevant determinants. In every instance, a comparable set of data was used to estimate the distribution for each of the 2 fiscal years—1966 and 1969.

Health care expenditures by State were also estimated by source of funds. For the public sector, outlays by type of expenditure and State were reported in volume I of this report. Private funds for each type of expenditure represent the difference between total and public outlays.

Hospital care.—Hospital care expenditures were estimated by State for three categories: non-Federal hospitals, Federal hospitals, and osteopathic hospitals. Total expenditures in non-Federal hospitals were allocated among States according to the distribution of hospital expenses as reported by the American Hospital Association (AHA) in their annual *Guide Issues*. The distribution of outlays in Federal hospitals was based on unpublished expenditure data supplied by the individual Federal agencies that operate hospitals—Veterans Administration, Defense Department, Indian Health, and Public Health Service. Total expenditures in osteopathic hospitals were distributed by State according to the product of the days of care in osteopathic hospitals and expense per patient day in community hospitals. The State data on days of care were supplied by the American Osteopathic Hospital Association. Expense per patient day in community hospitals by State came from the AHA *Guide Issues*.

Physicians' services.—Expenditures for physicians' services represent total gross business receipts of physicians in private practice (as shown in *Statistics of Income*, published by the Internal Revenue Service), gross receipts of medical laboratories that represent patient payments, estimated gross business income of osteopaths, and the estimated expense of group-practice prepayment plans in providing physicians' services (to the extent that these are not included in physicians' income from self-employment). Estimated receipts of physicians for making life insurance examinations are deducted.

The allocation of expenditures for physicians' services among the States was based chiefly on the product of the number of practitioners and mean annual income.

The number of office-based physicians in each State is reported by the American Medical Association (AMA) in their annual report *Distribution of Physicians*. The number of osteopaths in each State is reported by the Public Health Service in their annual report *Health Resources Statistics*. Mean earnings of physicians were based on unpublished State data prepared by the Internal Revenue Service for a special study and on divisional data reported by the AMA in their annual report, *Profile of Medical Practice*.

Expenditures for medical laboratories were allocated by State according to the State distribution of independent laboratories certified under Medicare. (See *Health Insurance Statistics*, "Health Insurance for the Aged: Participating Health Facilities, July 1969," HI-18, 1970, Office of Research and Statistics, Social Security Administration, and *Medicare: Health Insurance for the Aged, 1967, Section 3,3: Participating Independent Laboratories*, 1971, Office of Research and Statistics, Social Security Administration).

The distribution of expenditures for physicians' services under group practice plans was based on unpublished data reported to the Social Security Administration. The deduction for life insurance examinations was allocated by State according to the population of persons under age 65.

Dentists' services.—The estimates of total expenditures for the services of dentists in private practice were based on the gross incomes from self-employment practice as reported by dentists to the Internal Revenue Service. The number of dentists by State was reported in *Health Resources Statistics*. Mean income by State was reported in the American Dental Association tri-annual studies, *Survey of Dental Practice*.

Other professional services.—The Internal Revenue Service reports data on the income of other health professionals in private practice. Salaries of visiting nurses, estimated from surveys conducted by the National League for Nursing, are added to the private income of other health professionals. State distributions were calculated for expenditures in four components of this category: private duty nurses (both registered nurses and licensed practical nurses); chiropractors; nurses employed in public health work; and other professional services (including dietitians, occupational therapists).

The State distribution of outlays for private duty nurses distinguishes between outlays for RN's and those for LPN's. In each case, the distribution was based on the number of active nurses and their fees or salary. Data on the number of nurses by State came from the American Nurses Association's (ANA) *Inventory of Registered Nurses and Inventory of Licensed Practical Nurses*. Fee or salary data are reported in *Facts About Nursing*.

Expenditures for full-time nurses employed in public health work were distributed according to the number of nurses so employed in each State at local official health units and the annual salary of these staff nurses in each region (reported in *Facts About Nursing*).

⁸For a description of the methodology used to estimate total expenditures for each type of expenditure, see Rice and Cooper, *op. cit.*

The remaining portion of outlays for other professional services is distributed according to the product of the number of professionals in other health professions in each State (reported in *Health Resources Statistics*) and State per capita personal income.

Drugs and drug sundries, eyeglasses and appliances.—Total expenditures for drugs and drug sundries and eyeglasses and appliances represent the sum of consumer expenditure estimates and the expenditures under all public programs for these products. Expenditures for drugs and appliances in institutions are excluded from the totals. The chief source of consumer estimates is the report of personal consumption expenditures from the Department of Commerce National Income Accounts in the *Survey of Current Business*. In estimating the consumer portion, payments under workmen's compensation are subtracted and counted as public expenditures instead.

The distribution of expenditures for drugs and drug sundries was based on the retail sales' distribution of prescription drugs by State (reported in *The Marketing Magazine*, Sales Management Inc., June issues).

The State distribution of eyeglasses and appliances was based on the number of optometrists, opticians, and contact lens specialists reported by State in *Health Resources Statistics* and the net income of optometrists reported by region in the 1964 and 1969 *Economic Survey*, American Optometric Association.

Nursing-home care.—Total U.S. expenditures for nursing-home care are based on data from an unpublished national survey of nursing homes financed by the Social Security Administration. Expenditures by State were based on utilization and charges.

Utilization represented the product of the number of beds and the occupancy rate, reported by State in *Health Resources Statistics*. Charges for 1969 were based on modal monthly charges reported by State in the report by the Public Health Service, National Center for Health

Statistics, "Charges for Care in Nursing Homes, United States, April-September 1968," *Vital and Health Statistics*, Series 12, No. 14. To obtain State estimates for 1966, 1964 regional charge data were adjusted by the 1969 State data. The 1964 data were reported by the National Center for Health Statistics in "Charges for Care in Institutions for the Aged and Chronically Ill, United States, May-June 1964," *Vital and Health Statistics*, Series 12, No. 9.

Other health services.—Items of expenditure that could not be elsewhere classified are brought together in the category "other health services." It includes, for each public program, the residual amount of expenditures not classified as a specific type of medical service. Public expenditures for other health services were distributed by State as reported in volume I of this report.

Private expenditures for this category represent outlays for industrial in-plant services. These services were distributed by State on the basis of the number of industrial nurses and their average weekly earnings. The number of industrial nurses in each State was reported by the ANA in *RN's 1966—An Inventory of Registered Nurses* and in *Facts About Nursing*. The latter report also showed average weekly earnings for 68 cities.

Health insurance benefits.—The data on the financial experience of health insurance organizations are reported annually by the Office of Research and Statistics in an article on private health insurance that appears in the *Social Security Bulletin*.

Health insurance benefits were distributed by State according to the benefit payments made to States as reported in the annual Health Insurance Institute report, *Source Book of Health Insurance Data*.

Philanthropy.—The expenditures of private voluntary health agencies (philanthropic organizations) for health care services and supplies were distributed by State on the basis of personal income.

LIST OF DETAILED TABLES

Basic Data

1. Fiscal 1966: Aggregate and per capita personal health care expenditures, by source of funds
2. Fiscal 1966: Percentage distribution of personal health care expenditures, by source of funds and State
3. Total, fiscal 1966: Aggregate personal health care expenditures, by type of expenditure and State
4. Private, fiscal 1966: Aggregate personal health care expenditures, by type of expenditure and State
5. Public, fiscal 1966: Aggregate personal health care expenditures, by type of expenditure and State
6. Total, fiscal 1966: Per capita personal health care expenditures, by type of expenditure and State
7. Private, fiscal 1966: Per capita personal health care expenditures, by type of expenditure and State
8. Public, fiscal 1966: Per capita personal health care expenditures, by type of expenditure and State
9. Total, fiscal 1966: Percentage distribution of personal health care expenditures, by type of expenditure for each State
10. Private, fiscal 1966: Percentage distribution of personal health care expenditures, by type of expenditure for each State
11. Public, fiscal 1966: Percentage distribution of personal health care expenditures, by type of expenditure for each State
12. Total, fiscal 1966: Percentage distribution of personal health care expenditures, by State for each type of expenditure
13. Private, fiscal 1966: Percentage distribution of personal health care expenditures, by State for each type of expenditure
14. Public, fiscal 1966: Percentage distribution of personal health care expenditures, by State for each type of expenditure
